The training of nurses in Romania is a complex process that combines initial training through: post-secondary nursing schools, bachelor's studies or both and continuous training through specialization courses. This paper explores both aspects of nurses training, highlighting the importance of continuous learning in the medical field.

In Romania, the initial training of nurses typically begins at the level of post-secondary nursing schools. These institutions offer specialized educational programs covering a wide range of topics relevant to medical practice. To advance their careers, to access certain positions, or to have an increase income, many nurses choose to pursue bachelor's studies in medical assistance.

Once they become practicing nurses, they are required to participate in continuing education courses to maintain their status as licensed practitioners. These courses are accredited and designed to provide Continuing Medical Education (CME) credits.

The training of nurses in Romania involves a continuous learning process, beginning at the post-secondary school level and extending through university studies and continuing education courses during service. This approach ensures that nurses are equipped with the knowledge and skills necessary to provide high-quality care and respond to the ever-changing requirements of the healthcare system.
